Overview of talk

- DESY-Zeuthen computing services
- Interactive Batch jobs
- AFS token handling mechanism

DESY-Zeuthen computing services

Central Service

DESY-Zeuthen computing services

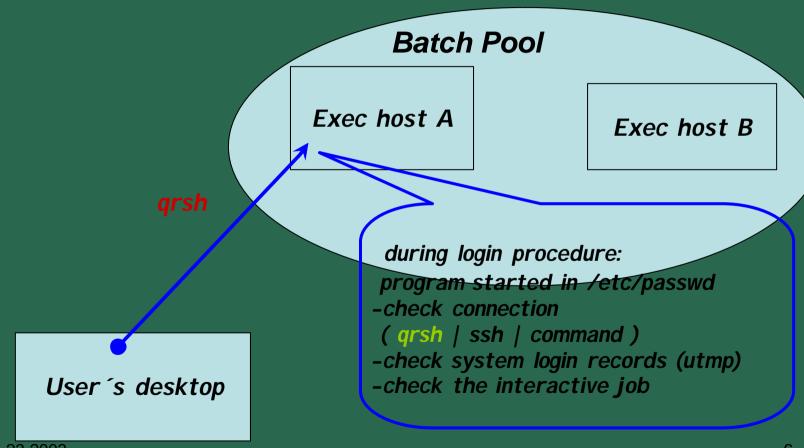

PC Batch farm:

- ~ 100 hosts
- Linux: based on SuSE 7.2
- PC hosts: cpu from single Pentium II to double Pentium IV, memory from 256 MB to 2 GB, hd from 10 GB to 80 GB per host
- Batch system: sgeee 5.3p2
- LAN: fast/gigabit ethernet

•

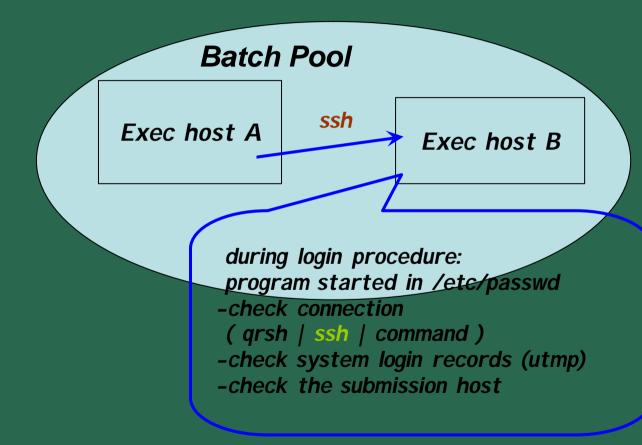

Interactive work fully managed by Batch system

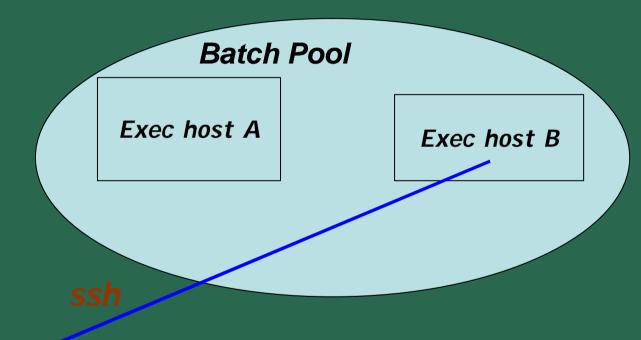

- Allows to login only via batch system. Direct login is forbidden!
- Batch configuration: ssh implementation
 (http://gridengine.sunsource.net/project/gridengine/howto/qrsh_ssh.html), interactive queues
- Host configuration: detection of the batch job, verification of request (qrsh, ssh, requested command), detection of background processes (started by users)

Current solution:

Submit host get_token_cmd

-get token from memory

-encrypt the token

QMASTER

Current solution:

QMASTER

ARC server - token prolongation

Exec host set_token_cmd

<u>Autenticted Remote Control:</u>

The mechanism granting an access to the special services on a not available host

Sep 23 2003

Current solution:

ARC server -token prolongation

Exec host set_token_cmd

Job start

<u>Autenticted Remote Control:</u>

The mechanism granting an access to the special services on a not available host

Sep 23 2003

1 1

Bad features:

- Fractions of jobs fail when ARC server is overloaded
- Requests to ARC server are coming from untrusted hosts

Better central managing:

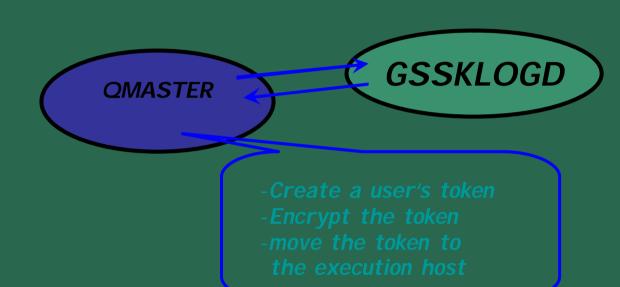

- AFS token is created on the master host only once and moved to the execution host (gssklog service)
- no requests from untrusted hosts

Developed solution:

Submit host User's preauthentication

Developed solution:

Developed solution:

Exec host set_token_cmd
Job start

- -decode the user's token
- -set the token into memory
- -Remove tokens from job's files
